## 1 Overview

The Swift Navigation Binary Protocol (SBP) is a fast, simple, and minimal binary protocol for communicating with Swift devices. It is the native binary protocol used by the Piksi GPS receiver to transmit solutions, observations, status, and debugging messages, as well as receive messages from the host operating system, such as differential corrections and the almanac. As such, it is an important interface with your Piksi receiver and the primary integration method with other systems.

This document provides a specification of SBP framing and the payload structures of the messages currently used with Swift devices. SBP client libraries in a variety of programming languages are available at [http://docs.swiftnav.com/wiki/SwiftNav\\_Binary\\_Protocol](http://docs.swiftnav.com/wiki/SwiftNav_Binary_Protocol).

## 2 Message Framing Structure

SBP consists of two pieces:

- an over-the-wire message framing format
- structured payload definitions

As of Version 2.0. , the frame consists of a 6-byte binary header section, a variable-sized payload field, and a 16-bit CRC value. All multibyte values are ordered in **little-endian** format. SBP uses the CCITT CRC16 (XMODEM implementation) for error detection<sup>1</sup>.

Offset (bytes)	Size (bytes)	Name	Description
0	1	Preamble	Denotes the start of frame transmission. Always 0x55.
1	2	Message Type	Identifies the payload contents.
3	2	Sender	A unique identifier of the sender. On the Piksi, this is set to the 2 least significant bytes of the device serial number. A stream of SBP messages may also include sender IDs for forwarded messages. By default, clients of 'libsbp' use a sender id value of '0x42'. Sender id '0x42' is used to represent device controllers such as the Piksi Console.
5	1	Length	Length (bytes) of the Payload field.
6	<i>N</i>	Payload	Binary message contents.
<i>N</i> + 6	2	CRC	Cyclic Redundancy Check of the frame's binary data from the Message Type up to the end of Payload (does not include the Preamble).
<i>N</i> + 8		Total Frame Length	

Table 2.0.1: Swift Binary Protocol message structure. *N* denotes a variable-length size.

## 3 NMEA-0183

Swift devices, such as the Piksi, also have limited support for the standard NMEA-0183 protocol.

Note that NMEA-0183 doesn't define standardized message string equivalents for many important SBP messages such as observations, baselines and ephemerides. For this reason it is strongly recommended to use SBP for new development. NMEA-0183 output is provided primarily to support legacy devices.

<sup>1</sup>CCITT 16-bit CRC Implementation uses parameters used by XMODEM, i.e. the polynomial:  $x^{16} + x^{12} + x^5 + 1$ . For more details, please see the implementation at <https://github.com/swift-nav/libsbp/blob/master/c/src/edc.c#L59>. See also *A Painless Guide to CRC Error Detection Algorithms* at [http://www.ross.net/crc/download/crc\\_v3.txt](http://www.ross.net/crc/download/crc_v3.txt)

## 4 Basic Formats and Payload Structure

The binary payload of an SBP message decodes into structured data based on the message type defined in the header. SBP uses several primitive numerical and collection types for defining payload contents.

Name	Size (bytes)	Description
s8	1	Signed 8-bit integer
s16	2	Signed 16-bit integer
s32	4	Signed 32-bit integer
s64	8	Signed 64-bit integer
u8	1	Unsigned 8-bit integer
u16	2	Unsigned 16-bit integer
u32	4	Unsigned 32-bit integer
u64	8	Unsigned 64-bit integer
float	4	Single-precision float (IEEE-754)
double	8	Double-precision float (IEEE-754)
array	—	Fixed or variable length array of any fill type
string	—	Fixed or variable length string (NULL padded/terminated)
bitfield	—	A primitive type, typically a u8, can encode boolean and enumerated status flags.

Table 4.0.2: SBP primitive types

### Example Message

As an example, consider this framed series of bytes read from a serial port:

55 02 02 cc 04 14 70 3d d0 18 cf ef ff ff ef e8 ff ff f0 18 00 00 00 05 00 43 94

This byte array decodes into a MSG\_BASELINE\_ECEF (see pg. 11), which reports the baseline position solution of the rover receiver relative to the base station receiver in Earth Centered Earth Fixed (ECEF) coordinates. The segments of this byte array and its contents break down as follows:

Field Name	Type	Value	Bytestring Segment
Preamble	u8	0x55	55
Message Type	u16	MSG_BASELINE_ECEF	02 02
Sender	u16	1228	cc 04
Length	u8	20	14
Payload	—	—	70 3d d0 18 cf ef ff ff ef e8 ff ff f0 18 00 00 00 05 00

## 5 Message Types

Packages define a logical collection of SBP messages. The contents and layout of messages in packages marked **stable** are unlikely to change in the future. **Draft** messages *will change with future development* and are detailed purely for *informational purposes only*. Many draft messages are implementation-defined, and some collections, such as the acquisition package, are used for internal development.

Package	Msg ID	Name	Size (bytes)	Description
<b>Stable</b>				
Logging	0x0401	MSG_LOG	$N + 1$	Plaintext logging messages with levels
	0x0402	MSG_FWD	$N + 2$	Wrapper for FWD a separate stream of information over SBP

## 6 Stable Message Definitions

### 6.1 Logging

Logging and debugging messages from the device.

#### MSG.LOG — 0x0401

This message contains a human-readable payload string from the device containing errors, warnings and informational messages at ERROR, WARNING, DEBUG, INFO logging levels.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	1	u8		level	Logging level
1	$N$	string		text	Human-readable string
	$N + 1$				Total Payload Length

0	EMERG
1	ALERT
2	CRIT
3	ERROR
4	WARN
5	NOTICE
6	INFO
7	DEBUG

Table 6.1.2: Logging level values (level[0:2])

**MSG\_FWD — 0x0402**

This message provides the ability to forward messages over SBP. This may take the form of wrapping up SBP messages received by Piksi for logging purposes or wrapping another protocol with SBP.

The source identifier indicates from what interface a forwarded stream derived. The protocol identifier identifies what the expected protocol the forwarded msg contains. Protocol 0 represents SBP and the remaining values are implementation defined.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	1	u8		source	source identifier
1	1	u8		protocol	protocol identifier
2	$N$	string		fwd_payload	variable length wrapped binary message
	$N + 2$				Total Payload Length

## 6.2 Navigation

Geodetic navigation messages reporting GPS time, position, velocity, and baseline position solutions. For position solutions, these messages define several different position solutions: single-point (SPP), RTK, and pseudo-absolute position solutions.

The SPP is the standalone, absolute GPS position solution using only a single receiver. The RTK solution is the differential GPS solution, which can use either a fixed/integer or floating carrier phase ambiguity. The pseudo-absolute position solution uses a user-provided, well-surveyed base station position (if available) and the RTK solution in tandem.

### MSG\_GPS\_TIME — 0x0102

This message reports the GPS time, representing the time since the GPS epoch began on midnight January 6, 1980 UTC. GPS time counts the weeks and seconds of the week. The weeks begin at the Saturday/Sunday transition. GPS week 0 began at the beginning of the GPS time scale.

Within each week number, the GPS time of the week is between between 0 and 604800 seconds ( $=60*60*24*7$ ). Note that GPS time does not accumulate leap seconds, and as of now, has a small offset from UTC. In a message stream, this message precedes a set of other navigation messages referenced to the same time (but lacking the ns field) and indicates a more precise time of these messages.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	2	u16	weeks	wn	GPS week number
2	4	u32	ms	tow	GPS time of week rounded to the nearest millisecond
6	4	s32	ns	ns	Nanosecond residual of millisecond-rounded TOW (ranges from -500000 to 500000)
10	1	u8		flags	Status flags (reserved)

MSG.UTC.TIME — 0x0103

This message reports the Universal Coordinated Time (UTC). Note the flags which indicate the source of the UTC offset value and source of the time fix.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	1	u8		flags	Indicates source and time validity
1	4	u32	ms	tow	GPS time of week rounded to the nearest millisecond
5	2	u16	year	year	Year

MSG\_POS\_ECEF — 0x0209

The position solution message reports absolute Earth Centered Earth Fixed (ECEF) coordinates and the status (single point vs pseudo-absolute RTK) of the position solution. If the rover receiver knows the surveyed position of the base station and has an RTK solution, this reports a pseudo-absolute position solution using the base station position and the rover’s RTK baseline vector. The full GPS time is given by the preceding MSG\_GPS\_TIME with the matching time-of-week (tow).

MSG\_POS\_LLH — 0x020A

This position solution message reports the absolute geodetic coordinates and the status (single point vs pseudo-absolute RTK) of the position solution. If the rover receiver knows the surveyed position of the base station and has an RTK solution, this reports a pseudo-absolute position solution using the base station position and the rover’s RTK baseline vector. The full GPS time is given by the preceding MSG\_GPS\_TIME with the matching time-of-week (tow).

## 6.3 Observation

Satellite observation messages from the device.

### **MSG.OBS — 0x004A**

The GPS observations message reports all the raw pseudorange and carrier phase observations for the satellites being tracked by the device. Carrier phase observation here is represented as a 40-bit fixed point number with Q32.8 layout (i.e. 32-bits of whole cycles and 8-bits of fractional cycles). The observations are interoperable with 3rd party receivers and conform with typical RTCMv3 GNSS observations.

The lock field represents the range of time for which a particular signal has maintained carrier phase lock. The minimum and maximum possible lock times for each value of the field can be described by the following piecewise function. Given the lock value,  $l$ , the minimum lock time is given by  $2^{(l+4)}$  ms and the maximum lock time is given by  $2^{(l+5)}$  ms provided  $n$  is not 0. If  $n$  is 0 the lower range is given to be 0 ms. Conversely, given a lock time ( $t$ ) in milliseconds, the field value is given by  $\text{floor}(\log_2(t) - 4)$  when  $t$  is greater than 32 ms or 0 if ( $t$ ) is less than 32 ms.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	4	u32	ms	header.t.tow	Milliseconds since start of GPS week
4	4	s32	ns	header.t.ns	Nanosecond residual of millisecond-rounded TOW (ranges from -500000 to 500000)
8	2	u16	week	header.t.wn	GPS week number
10	1	u8		header.n_obs	Total number of observations. First nibble is the size of the sequence (n), second nibble is the zero-indexed counter (ith packet of n)
$17N + 11$	4	u32	2 cm	obs[N].P	Pseudorange observation
$17N + 15$	4	s32	cycles	obs[N].L.i	Carrier phase whole cycles
$17N + 19$	1	u8	cycles / 256	obs[N].L.f	Carrier phase fractional part
$17N + 20$	2	s16	Hz	obs[N].D.i	Doppler whole Hz
$17N + 22$	1	u8	Hz / 256	obs[N].D.f	Doppler fractional part
$17N + 23$	1	u8	dB Hz / 4	obs[N].cn0	Carrier-to-Noise density. Zero implies invalid cn0.
$17N + 24$	1	u8		obs[N].lock	Lock timer. This value gives an indication of the time for which a signal has maintained continuous phase lock. Whenever a signal has lost and regained lock, this value is reset to zero. It is encoded according to DF402 from the RTCM 10403.2 Amendment 2 specification. Valid values range from 0 to 15 and the most significant nibble is reserved for future use.
$17N + 25$	1	u8		obs[N].flags	Measurement status flags. A bit field of flags providing the status of this observation. If this field is 0 it means only the Cn0 estimate for the signal is valid.
$17N + 26$	1	u8		obs[N].sid.sa	Constellation-specific satellite identifier
$17N + 27$	1	u8		obs[N].sid.co	Signal constellation, band and code
$17N + 11$					Total Payload Length

## 6.4 Settings

Messages for reading and writing the device's device settings.

Note that some of these messages share the same message type ID for both the host request and the device response. See the accompanying document for descriptions of settings configurations and examples:

<https://github.com/swift-nav/piksi/blob/master/docs/settings.pdf>

### MSG\_SETTINGS\_SAVE — 0x00A1

The save settings message persists the device's current settings configuration to its onboard flash memory file system.

## 6.5 System

Standardized system messages from Swift Navigation devices.

### MSG\_STARTUP — 0xFF00

The system start-up message is sent once on system start-up. It notifies the host or other attached devices that the system has started and is now ready to respond to commands or configuration requests.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	1	u8		cause	Cause of startup

MSG\_HEARTBEAT — 0xFFFF

The heartbeat message is sent periodically to inform the host or other attached devices that the system is running. It is used to monitor system malfunctions. It also contains status flags that indicate to the host the status of the system and whether it is operating correctly. Currently, the expected heartbeat interval is 1 sec.

The system error flag is used to indicate that an error has occurred in the system. To determine the source of the error, the remaining error flags should be inspected.

## 7 Draft Message Definitions

### 7.1 Acquisition

Satellite acquisition messages from the device.

#### **MSG\_ACQ\_RESULT — 0x001F**

This message describes the results from an attempted GPS signal acquisition search for a satellite PRN over a code phase/carrier frequency range. It contains the parameters of the point in the acquisition search space with the best carrier-to-noise (CN/0) ratio.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	4	float	dB Hz	cn0	CN/0 of best point
4	4	float	chips	cp	Code phase of best point
8	4	float	hz	cf	Carrier frequency of best point
12	2	u16		sid.sat	Constellation-specific satellite identifier
14	1	u8		sid.code	Signal constellation, band and code
15	1	u8		sid.reserved	Reserved

**MSG\_ACQ\_SV\_PROFILE — 0x001E**

The message describes all SV profiles during acquisition time. The message is used to debug and measure the performance.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
$35N + 0$	1	u8		<code>acq_sv_profile[N].job.type</code>	SV search job type (deep, fall-back, etc)
$35N + 1$	1	u8		<code>acq_sv_profile[N].status</code>	Acquisition status 1 is Success, 0 is Failure
$35N + 2$	2	u16	dB-Hz*10	<code>acq_sv_profile[N].cn0</code>	CN0 value. Only valid if status is '1'
$35N + 4$	1	u8	ms	<code>acq_sv_profile[N].int.time</code>	Acquisition integration time
$35N + 5$	2	u16		<code>acq_sv_profile[N].sid.sat</code>	Constellation-specific satellite identifier
$35N + 7$	1	u8		<code>acq_sv_profile[N].sid.code</code>	Signal constellation, band and code
$35N + 8$	1	u8		<code>acq_sv_profile[N].sid.reserved</code>	Reserved
$35N + 9$	2	u16	Hz	<code>acq_sv_profile[N].bin.width</code>	Acq frequency bin width
$35N + 11$	4	u32	ms	<code>acq_sv_profile[N].timestamp</code>	Timestamp of the job complete event
$35N + 15$	4	u32	us	<code>acq_sv_profile[N].time.spent</code>	Time spent to search for sid.code
$35N + 19$	4	s32	Hz	<code>acq_sv_profile[N].cf.min</code>	Doppler range lowest frequency
$35N + 23$	4	s32	Hz	<code>acq_sv_profile[N].cf.max</code>	Doppler range highest frequency
$35N + 27$	4	s32	Hz	<code>acq_sv_profile[N].cf</code>	Doppler value of detected peak. Only valid if status is '1'
$35N + 31$	4	u32	chips*10	<code>acq_sv_profile[N].cp</code>	Codephase of detected peak. Only valid if status is '1'
$35N$					Total Payload Length

## 7.2 Ext Events

Messages reporting accurately-timestamped external events, e.g. camera shutter time.

### MSG\_EXT\_EVENT — 0x0101

Reports detection of an external event, the GPS time it occurred, which pin it was and whether it was rising or falling.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	2	u16	weeks	wn	GPS week number
2	4	u32	ms	tow	GPS time of week rounded to the nearest millisecond
6	4	s32	ns	ns	Nanosecond residual of millisecond-rounded TOW (ranges from -500000 to 500000)
10	1	u8		flags	Flags
11	1	u8		pin	Pin number. 0..9 = DEBUG0..9.

## 7.3 File IO

Messages for using device's onboard flash filesystem functionality. This allows data to be stored persistently in the device's program flash with wear-levelling using a simple filesystem interface. The file system interface (CFS) defines an abstract API for reading directories and for reading and writing files.

Note that some of these messages share the same message type ID for both the host request and the device response.

### MSG\_FILEIO\_READ\_REQ — 0x00A8

The file read message reads a certain length (up to 255 bytes) from a given offset into a file, and returns the data in a MSG\_FILEIO\_READ\_RESP message where the message length field indicates how many bytes were successfully read. The sequence number in the request will be returned in the response. If the message is invalid, a followup MSG\_PRINT message will print "Invalid fileio read message". A device will only respond to this message when it is received from sender ID 0x42.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	4	u32		<code>sequence</code>	Read sequence number
4	4	u32	bytes	<code>offset</code>	File offset
8	1	u8	bytes	<code>chunk_size</code>	Chunk size to read
9	<i>N</i>	string		<code>filename</code>	Name of the file to read from
	<i>N + 9</i>				Total Payload Length

Table 7.3.1: MSG\_FILEIO\_READ\_REQ 0x00A8 message structure

**MSG\_FILEIO\_READ\_RESP — 0x00A3**

The file read message reads a certain length (up to 255 bytes) from a given offset into a file, and returns the data in a message where the message length field indicates how many bytes were successfully read. The sequence number in the response is preserved from the request.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	4	u32		sequence	Read sequence number

	$N + 4$				Total Payload Length

Table 7.3.2: MSG\_FILEIO\_READ\_RESP 0x00A3 message structure

**MSG\_FILEIO\_READ\_DIR\_REQ — 0x00A9**

The read directory message lists the files in a directory on the device's onboard flash file system. The offset parameter can be used to skip the first  $n$  elements of the file list. Returns a MSG\_FILEIO\_READ\_DIR\_RESP message containing the directory listings as a NULL delimited list. The listing is chunked over multiple SBP packets. The sequence number in the request will be returned in the response. If message is invalid, a followup MSG\_PRINT message will print "Invalid fileio read message". A device will only respond to this message when it is received from sender ID 0x42.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	4	u32		<b>sequence</b>	Read sequence number
4	4	u32		<b>offset</b>	The offset to skip the first $n$ elements of the file list

**MSG\_FILEIO\_READ\_DIR\_RESP — 0x00AA**

The read directory message lists the files in a directory on the device's onboard flash file system. Message contains the directory listings as a NULL delimited list. The listing is chunked over multiple SBP packets and the end of the list is identified by an entry containing just the character 0xFF. The sequence number in the response is preserved from the request.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	4	u32		<b>sequence</b>	Read sequence number

**MSG\_FILEIO\_REMOVE — 0x00AC**

The file remove message deletes a file from the file system. If the message is invalid, a followup MSG\_PRINT message will print "Invalid fileio remove message". A device will only process this message when it is received from sender ID 0x42.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	<i>N</i>	string		<code>filename</code>	Name of the file to delete
	<i>N</i>				Total Payload Length

Table 7.3.5: MSG\_FILEIO\_REMOVE 0x00AC message structure

**MSG\_FILEIO\_WRITE\_REQ — 0x00AD**

The file write message writes a certain length (up to 255 bytes) of data to a file at a given offset. Returns a copy of the original MSG\_FILEIO\_WRITE\_RESP message to check integrity of the write. The sequence number in the request will be returned in the response. If message is invalid, a followup MSG\_PRINT message will print "Invalid fileio write message". A device will only process this message when it is received from sender ID 0x42.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	4	u32		<b>sequence</b>	Write sequence number
4	4	u32	bytes	<b>offset</b>	Offset into the file at which to start writing in bytes

## 7.4 Piksi

System health, configuration, and diagnostic messages specific to the Piksi L1 receiver, including a variety of legacy messages that may no longer be used.

### **MSG\_ALMANAC — 0x0069**

This is a legacy message for sending and loading a satellite almanac onto the Piksi's flash memory from the host.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
	0				Total Payload Length

Table 7.4.1: MSG\_ALMANAC 0x0069 message structure

**MSG\_SET\_TIME — 0x0068**

This message sets up timing functionality using a coarse GPS time estimate sent by the host.

	0				Total Payload Length

Table 7.4.2: MSG\_SET\_TIME 0x0068 message structure

**MSG\_RESET — 0x00B2**

This message from the host resets the Piksi back into the bootloader.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
	0				Total Payload Length

Table 7.4.3: MSG\_RESET 0x00B2 message structure

**MSG\_CW\_RESULTS — 0x00C0**

This is an unused legacy message for result reporting from the CW interference channel on the SwiftNAP. This message will be removed in a future release.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
	0				Total Payload Length

Table 7.4.4: MSG\_CW\_RESULTS 0x00C0 message structure

**MSG\_CW\_START — 0x00C1**

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
	0				Total Payload Length

Table 7.4.5: MSG\_CW\_START 0x00C1 message structure

MSG\_RESET\_FILTERS — 0x0022

This message resets either the DGNSS Kalman filters or Integer Ambiguity Resolution (IAR) process.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	1	u8		<code>filter</code>	Filter flags
	1				Total Payload Length

**MSG\_INIT\_BASE — 0x0023**

This message initializes the integer ambiguity resolution (IAR) process on the Piksi to use an assumed baseline position between the base station and rover receivers. Warns via MSG\_PRINT if there aren't a shared minimum number (4) of satellite observations between the two.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
	0				Total Payload Length

Table 7.4.8: MSG\_INIT\_BASE 0x0023 message structure

**MSG\_THREAD\_STATE — 0x0017**

The thread usage message from the device reports real-time operating system (RTOS) thread usage statistics for the named thread. The reported percentage values must be normalized.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	20	string		name	Thread name (NULL terminated)
20	2	u16		cpu	Percentage cpu use for this thread. Values range from 0 - 1000 and needs to be renormalized to 100
22	4	u32	bytes	stack_free	Free stack space for this thread
	26				Total Payload Length

Table 7.4.9: MSG\_THREAD\_STATE 0x0017 message structure

**MSG\_UART\_STATE — 0x001D**

The UART message reports data latency and throughput of the UART channels providing SBP I/O. On the default Piksi configuration, UARTs A and B are used for telemetry radios, but can also be host access ports for embedded hosts, or other interfaces in future. The reported percentage values must be normalized. Observations latency and period can be used to assess the health of the differential corrections link. Latency provides the timeliness of received base observations while the period indicates their likelihood of transmission.

Offset (bytes)	Size (bytes)	Format	Units	Name	Description
0	4	float	kB/s	uart_a.tx_throughput	UART transmit throughput
4	4	float	kB/s	uart_a.rx_throughput	UART receive throughput
8	2	u16		uart_a.crc_error_count	UART CRC error count
