1 Overview

The Swift Navigation Binary Protocol (SBP) is a fast, simple, and minimal binary protocol for communicating with Swift devices. It is the native binary protocol used by the Piksi GPS receiver to transmit solutions, observations, status, and debugging messages, as well as receive messages from the host operating system, such as differential corrections and the almanac. As such, it is an important interface with your Piksi receiver and the primary integration method with other systems.

This document provides a specification of SBP framing and the payload structures of the messages currently used with Swift devices. SBP client libraries in a variety of programming languages are available at http://docs.swiftnav.com/wiki/SwiftNav_Binary_Protocol.

2 Message Framing Structure

SBP consists of two pieces:

- an over-the-wire message framing format
- structured payload definitions

As of Version 2.3.2, the frame consists of a 6-byte binary header section, a variable-sized payload field, and a 16-bit CRC value. All multibyte values are ordered in **little-endian** format. SBP uses the CCITT CRC16 (XMODEM implementation) for error detection¹.

| Offset (bytes) | Size (bytes) | Name | Description |
|-------------------|--------------|-----------------|--|
| 0 | 1 | Preamble | Denotes the start of frame transmission. Always 0x55. |
| 1 | 2 | Message Type | Identifies the payload contents. |
| 3 | 2 | Sender | A unique identifier of the sender. On the Piksi, this is set to the 2 least significant bytes of the device serial number. A stream of SBP messages may also include sender IDs for forwarded messages. By default, clients of 'libsbp' use a sender id value of '0x42'. Sender id '0x42' is used to represent device controllers such as the Piksi Console. |
| 5 | 1 | Length | Length (bytes) of the Payload field. |
| 6 | Ν | Payload | Binary message contents. |
| <i>N</i> + 6 | 2 | CRC | Cyclic Redundancy Check of the frame's binary data from the Message Type up to the end of Payload (does not include the Preamble). |
| | N + 8 | | Total Frame Length |

Table 2.0.1: Swift Binary Protocol message structure. N denotes a variable-length size.

3 NMEA-0183

Swift devices, such as the Piksi, also have limited support for the standard NMEA-0183 protocol.

Note that NMEA-0183 doesn't define standardized message string equivalents for many important SBP messages such as observations, baselines and ephemerides. For this reason it is strongly recommended to use SBP for new development. NMEA-0183 output is provided primarily to support legacy devices.

 $^{^1}$ CCITT 16-bit CRC Implementation uses parameters used by XMODEM, i.e. the polynomial: $x^{16} + x^{12} + x^5 + 1$. For more details, please see the implementation at https://github.com/swift-nav/libsbp/blob/master/c/src/edc.c#L59. 4 Basic Formats and Payload Structure

The binary payload of an SBP message decodes into structured data based on the message type defined in the header. SBP uses several primitive numerical and collection types for defining payload contents.

| Name | Size (bytes) | Description | | | |
|----------|--------------|---|--|--|--|
| s8 | 1 | Signed 8-bit integer | | | |
| s16 | 2 | Signed 16-bit integer | | | |
| s32 | 4 | Signed 32-bit integer | | | |
| s64 | 8 | Signed 64-bit integer | | | |
| u8 | 1 | Unsigned 8-bit integer | | | |
| u16 | 2 | Unsigned 16-bit integer | | | |
| u32 | 4 | Unsigned 32-bit integer | | | |
| u64 | 8 | Unsigned 64-bit integer | | | |
| float | 4 | Single-precision float (IEEE-754) | | | |
| double | 8 | Double-precision float (IEEE-754) | | | |
| array | _ | Fixed or variable length array of any fill type | | | |
| string | _ | Fixed or variable length string (NULL padded/terminated) | | | |
| bitfield | _ | A primitive type, typically a u8, can encode boolean and enumerated status flags. | | | |

Example Message

As an example, consider this framed series of bytes read from a serial port:

55 02 02 cc 04 14 70 3d d0 18 cf ef ff ff ef e8 ff ff f0 18 00 00 00 00 05 00 43 94

This byte array decodes into a MSG_BASELINE_ECEF (see pg. 12), which reports the baseline position solution of the rover receiver relative to the base station receiver in Earth Centered Earth Fixed (ECEF) coordinates. The segments of this byte array and its contents break down as follows:

| Field Name | Туре | Value | Bytestring Segment |
|-------------------|------|---------------------------|-------------------------------------|
| Preamble | u8 | 0x55 | 55 |
| Message Type | u16 | MSG_BASELINE_ECEF | 02 02 |

5 Message Types

Packages define a logical collection of SBP messages. The contents and layout of messages in packages marked **stable** are unlikely to change in the future. **Draft** messages *will change with future development* and are detailed purely for *informational purposes only*. Many draft messages are implementation-defined, and some collections, such as the acquisition package, are used for internal development.

6.1 Logging

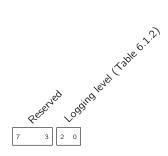

Logging and debugging messages from the device.

$MSG_LOG - 0x0401 - 1025$

This message contains a human-readable payload string from the device containing errors, warnings and informational messages at ERROR, WARNING, DEBUG, INFO logging levels.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

$MSG_FWD - 0x0402 - 1026$

This message provides the ability to forward messages over SBP. This may take the form of wrapping up SBP messages received by Piksi for logging purposes or wrapping another protocol with SBP.

The source identifier indicates from what interface a forwarded stream derived. The protocol identifier identifies what the expected protocol the forwarded msg contains. Protocol 0 represents SBP and the remaining values are implementation defined.

6.2 Navigation

Geodetic navigation messages reporting GPS time, position, velocity, and baseline position solutions. For position solutions, these messages define several different position solutions: single-point (SPP), RTK, and pseudo-absolute position solutions.

The SPP is the standalone, absolute GPS position solution using only a single receiver. The RTK solution is the differential GPS solution, which can use either a fixed/integer or floating carrier phase ambiguity. The pseudo-absolute position solution uses a user-provided, well-surveyed base station position (if available) and the RTK solution in tandem.

When the inertial navigation mode indicates that the IMU is used, all messages are reported in the vehicle body frame as defined by device settings. By default, the vehicle body frame is configured to be coincident with the antenna phase center. When there is no inertial navigation, the solution will be reported at the phase center of the antenna.

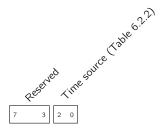

MSG_GPS_TIME — 0x0102 — 258

This message reports the GPS time, representing the time since the GPS epoch began on midnight January 6, 1980 UTC. GPS time counts the weeks and seconds of the week. The weeks begin at the Saturday/Sunday transition. GPS week 0 began at the beginning of the GPS time scale.

Within each week number, the GPS time of the week is between between 0 and 604800 seconds (=60*60*24*7). Note that GPS time does not accumulate leap seconds, and as of now, has a small offset from UTC. In a message stream, this message precedes a set of other navigation messages referenced to the same time (but lacking the ns field) and indicates a more precise time of these messages.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-------|-------------|--|
| 0 | 2 | u16 | weeks | wn | GPS week number |
| 2 | 4 | u32 | ms | tow | GPS time of week rounded to the nearest millisecond |

MSG_POS_ECEF — 0x0209 — 521

The position solution message reports absolute Earth Centered Earth Fixed (ECEF) coordinates and the status (single point vs pseudo-absolute RTK) of the position solution. If the rover receiver knows the surveyed position of the base station and has an RTK solution, this reports a pseudo-absolute position solution using the base station position and the rover's RTK baseline vector. The full GPS time is given by the preceding MSG_GPS_TIME with the matching time-of-week (tow).

$MSG_POS_ECEF_COV - 0x0214 - 532$

The position solution message reports absolute Earth Centered Earth Fixed (ECEF) coordinates and the status (single point vs pseudo-absolute RTK) of the position solution. The message also reports the upper triangular portion of the 3x3 covariance matrix. If the receiver knows the surveyed position of the base station and has an RTK solution, this reports a pseudo-absolute position solution using the base station position and the rover's RTK baseline vector. The full GPS time is given by the preceding MSG_GPS_TIME with the matching time-of-week (tow).

$MSG_POS_LLH - 0x020A - 522$

This position solution message reports the absolute geodetic coordinates and the status (single point vs pseudo-absolute RTK) of the position solution. If the rover receiver knows the surveyed position of the base station and has an RTK solution, this reports a pseudo-absolute position solution using the base station position and the rover's RTK baseline vector. The full GPS time is given by the preceding MSG_GPS_TIME with the matching time-of-week (tow).

$MSG_POS_LLH_COV - 0x0211 - 529$

This position solution message reports the absolute geodetic coordinates and the status (single point vs pseudo-absolute RTK) of the position solution as well as the upper triangle of the 3x3 covariance matrix. The position information and Fix Mode flags should follow the MSG_POS_LLH message. Since the covariance matrix is computed in the local-level North, East, Down frame, the covariance terms follow with that convention. Thus, covariances are reported against the "downward" measurement and care should be taken with the sign convention.

$MSG_VEL_BODY - 0x0213 - 531$

This message reports the velocity in the Vehicle Body Frame. By convention, the x-axis should point out the nose of the vehicle and represent the forward direction, while as the y-axis should point out the right hand side of the vehicle. Since this is a right handed system, z should point out the bottom of the vehicle. The orientation and origin of the Vehicle Body Frame are specified via the device settings. The full GPS time is given by the preceding MSG_GPS_TIME with the matching time-of-week (tow).

6.3 Observation

Satellite observation messages from the device.

$MSG_{-}OBS - 0x004A - 74$

The GPS observations message reports all the raw pseudorange and carrier phase observations for the satellites being tracked by the device. Carrier phase observation here is represented as a 40-bit fixed point number with Q32.8 layout (i.e. 32-bits of whole cycles and 8-bits of fractional cycles). The observations are be interoperable with 3rd party receivers and conform with typical RTCMv3 GNSS observations.

| 17 <i>N</i> + 24 | 1 | u8 | | obs[N].lock | Lock timer. This value gives an indication of the time for which a signal has maintained continuous phase lock. Whenever a signal has lost and regained lock, this value is reset to zero. It is encoded according to DF402 from the RTCM 10403.2 Amendment 2 specification. Valid values range from 0 to 15 and the most significant nibble is reserved for future use. |
| 17 <i>N</i> + 25 | 1 | u8 | | obs[N].flags | Measurement status flags. A bit field of flags providing the status of this observation. If this field is 0 it means only the Cn0 estimate for the signal is valid. |

6.4 Settings

Messages for reading and writing the device's device settings.

Note that some of these messages share the same message type ID for both the host request and the device response. See the accompanying document for descriptions of settings configurations and examples:

https://github.com/swift-nav/piksi\ firmware/blob/master/docs/settings.pdf

$MSG_SETTINGS_SAVE - 0x00A1 - 161$

The save settings message persists the device's current settings configuration to its onboard flash memory file system.

6.5 System

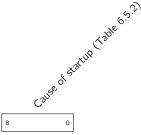

Standardized system messages from Swift Navigation devices.

MSG_STARTUP — 0xFF00 — 65280

The system start-up message is sent once on system start-up. It notifies the host or other attached devices that the system has started and is now ready to respond to commands or configuration requests.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

MSG_HEARTBEAT — 0xFFFF — 65535

The heartbeat message is sent periodically to inform the host or other attached devices that the system is running. It is used to monitor system malfunctions. It also contains status flags that indicate to the host the status of the system and whether it is operating correctly. Currently, the expected heartbeat interval is 1 sec.

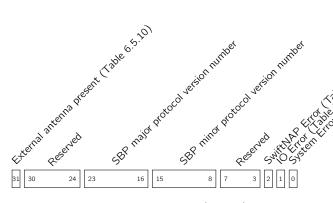

The system error flag is used to indicate that an error has occurred in the system. To determine the source of the error, the remaining error flags should be inspected.

7 Draft Message Definitions

7.1 Acquisition

Satellite acquisition messages from the device.

$MSG_ACQ_RESULT - 0x002F - 47$

This message describes the results from an attempted GPS signal acquisition search for a satellite PRN over a code phase/carrier frequency range. It contains the parameters of the point in the acquisition search space with the best carrier-to-noise (CN/0) ratio.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

7.2 Ext Events

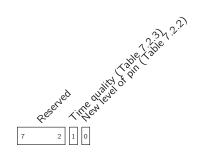

Messages reporting accurately-timestamped external events, e.g. camera shutter time.

$MSG_EXT_EVENT - 0x0101 - 257$

Reports detection of an external event, the GPS time it occurred, which pin it was and whether it was rising or falling.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-------|-------------|--|
| 0 | 2 | u16 | weeks | wn | GPS week number |

7.3 File IO

Messages for using device's onboard flash filesystem functionality. This allows data to be stored persistently in the device's program flash with wear-levelling using a simple filesystem interface. The file system interface (CFS) defines an abstract API for reading directories and for reading and writing files.

Note that some of these messages share the same message type ID for both the host request and the device response.

MSG_FILEIO_READ_REQ — 0x00A8 — 168

The file read message reads a certain length (up to 255 bytes) from a given offset into a file, and returns the data in a MSG_FILEIO_READ_RESP message where the message length field indicates how many bytes were successfully read. The sequence number in the request will be returned in the response. If the message is invalid, a followup MSG_PRINT message will print "Invalid fileio read message". A device will only respond to this message when it is received from sender ID 0x42.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-------|------------|-------------------------------|
| 0 | 4 | u32 | | sequence | Read sequence number |
| 4 | 4 | u32 | bytes | offset | File offset |

Table 7.3.1: MSG_FILEIO_READ_REQ 0x00A8 message structure

$MSG_FILEIO_READ_RESP - 0x00A3 - 163$

The file read message reads a certain length (up to 255 bytes) from a given offset into a file, and returns the data in a message where the message length field indicates how many bytes were successfully read. The sequence number in the response is preserved from the request.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

Table 7.3.2: MSG_FILEIO_READ_RESP 0x00A3 message structure

MSG_FILEIO_READ_DIR_REQ — 0x00A9 — 169

The read directory message lists the files in a directory on the device's onboard flash file system. The offset parameter can be used to skip the first n elements of the file list. Returns a MSG_FILEIO_READ_DIR_RESP message containing the directory listings as a NULL delimited list. The listing is chunked over multiple SBP packets. The sequence number in the request will be returned in the response. If message is invalid, a followup MSG_PRINT message will print "Invalid fileio read message". A device will only respond to this message when it is received from sender ID 0x42.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|-------|----------|--|
| 0 | 4 | u32 | | sequence | Read sequence number |
| 4 | 4 | u32 | | offset | The offset to skip the first n elements of the file list |

| | N + 8 | | | | Total Payload Length |

Table 7.3.3: MSG_FILEIO_READ_DIR_REQ 0x00A9 message structure

MSG_FILEIO_READ_DIR_RESP — 0x00AA — 170

The read directory message lists the files in a directory on the device's onboard flash file system. Message contains the directory listings as a NULL delimited list. The listing is chunked over multiple SBP packets and the end of the list is identified by an entry containing just the character 0xFF. The sequence number in the response is preserved from the request.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|---------------|--------------|-------|------|---|
| 0 4 | 4 <i>N</i> | u32 u8[N] | | - | Read sequence number Contents of read directory |

Table 7.3.4: MSG_FILEIO_READ_DIR_RESP 0x00AA message structure

$MSG_FILEIO_REMOVE - 0x00AC - 172$

The file remove message deletes a file from the file system. If the message is invalid, a followup MSG_PRINT message will print "Invalid fileio remove message". A device will only process this message when it is received from sender ID 0x42.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

Table 7.3.5: MSG_FILEIO_REMOVE 0x00AC message structure

MSG_FILEIO_WRITE_REQ — 0x00AD — 173

The file write message writes a certain length (up to 255 bytes) of data to a file at a given offset. Returns a copy of the original MSG_FILEIO_WRITE_RESP message to check integrity of the write. The sequence number in the request will be returned in the response. If message is invalid, a followup MSG_PRINT message will print "Invalid fileio write message". A device will only process this message when it is received from sender ID 0x42.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

Table 7.3.6: MSG_FILEIO_WRITE_REQ 0x00AD message structure

MSG_FILEIO_WRITE_RESP — 0x00AB — 171

The file write message writes a certain length (up to 255 bytes) of data to a file at a given offset. The message is a copy of the original MSG_FILEIO_WRITE_REQ message to check integrity of the write. The sequence number in the response is preserved from the request.

7.4 Imu

Inertial Measurement Unit (IMU) messages.

$MSG_IMU_RAW - 0x0900 - 2304$

Raw data from the Inertial Measurement Unit, containing accelerometer and gyroscope readings. The sense of the measurements are to be aligned with the indications on the device itself.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

7.6 Orientation

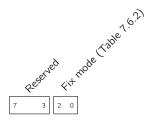

Orientation Messages

MSG_BASELINE_HEADING — 0x020F — 527

This message reports the baseline heading pointing from the base station to the rover relative to True North. The full GPS time is given by the preceding MSG_GPS_TIME with the matching time-of-week (tow). It is intended that time-matched RTK mode is used when the base station is moving.

MSG_ORIENT_EULER — 0x0221 — 545

This message reports the yaw, pitch, and roll angles of the vehicle body frame. The rotations should applied intrinsically in the order yaw, pitch, and roll in order to rotate the from a frame aligned with the local-level NED frame to the vehicle body frame.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |

MSG_ANGULAR_RATE — 0x0222 — 546

This message reports the orientation rates in the vehicle body frame. The values represent the measurements a strapped down gyroscope would make and are not equivalent to the time derivative of the Euler angles. The orientation and origin of the user frame is specified via device settings. By convention, the vehicle x-axis is expected to be aligned with the forward direction, while the vehicle y-axis is expected to be aligned with the right direction, and the vehicle z-axis should be aligned with the down direction.

Table 7.7.11: MSG_THREAD_STATE 0x0017 message structure

$MSG_UART_STATE - 0x001D - 29$

The UART message reports data latency and throughput of the UART channels providing SBP I/O. On the default Piksi configuration, UARTs A and B are used for telemetry radios, but can also be host access ports for embedded hosts, or other interfaces in future. The reported percentage values must be normalized. Observations latency and period can be used to assess the health of the differential corrections link. Latency provides the timeliness of received base observations while the period indicates their likelihood of transmission.

${\sf MSG_COMMAND_OUTPUT-0x00BC-188}$

Returns the standard output and standard error of the command requested by MSG_COMMAND_REQ. The sequence number can be used to filter for filtering the correct command.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|---------------|---------------|-------|------------------|--|
| 0 4 | 4 <i>N</i> | u32 string | | sequence line | Sequence number Line of standard output or standard error |
| | N + 4 | | | | Total Payload Length |

$MSG_NETWORK_STATE_REQ - 0x00BA - 186$

Request state of Piksi network interfaces. Output will be sent in MSG_NETWORK_STATE_RESP messages

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|-------|------|----------------------|
| | 0 | | | | Total Payload Length |

Table 7.7.23: MSG_NETWORK_STATE_REQ 0x00BA message structure

MSG_NETWORK_STATE_RESP — 0x00BB — 187

The state of a network interface on the Piksi. Data is made to reflect output of ifaddrs struct returned by getifaddrs in c.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-------|-------------------|--|
| 0 | 4 | u8[4] | | ipv4_address | IPv4 address (all zero when unavailable) |
| 4 | 1 | u8 | | ipv4_mask_size | IPv4 netmask CIDR notation |
| 5 | 16 | u8[16] | | ipv6_address | IPv6 address (all zero when unavailable) |
| 21 | 1 | u8 | | ipv6_mask_size | IPv6 netmask CIDR notation |
| 22 | 4 | u32 | | rx_bytes | Number of Rx bytes |
| 26 | 4 | u32 | | ${\sf tx_bytes}$ | Number of Tx bytes |
| 30 | 16 | string | | $interface_name$ | Interface Name |
| 46 | 4 | u32 | | flags | Interface flags from SIOCGIFFLAGS |
| | 50 | | | | Total Payload Length |

$\mathsf{MSG_SPECAN} - 0\mathsf{x}0051 - 81$

Spectrum analyzer packet.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|-------|-------------------------|---|
| 0 | 2 | u16 | | channel_tag | Channel ID |
| 2 | 4 | u32 | ms | t.tow | Milliseconds since start of GPS week |
| 6 | 4 | s32 | ns | t.ns_residual | Nanosecond residual of millisecond- rounded TOW (ranges from -500000 to 500000) |
| 10 | 2 | u16 | week | t.wn | GPS week number |
| 12 | 4 | float | MHz | freq_ref | Reference frequency of this packet |
| 16 | 4 | float | MHz | freq_step | Frequency step of points in this packet |
| 20 | 4 | float | dB | amplitude_ref | Reference amplitude of this packet |
| 24 | 4 | float | dB | ${\tt amplitude_unit}$ | Amplitude unit value of points in this packet |
| 28 | Ν | u8[N] | | amplitude_value | Amplitude values (in the above units) of points in this packet |
| | N + 28 | | | | Total Payload Length |

7.8 Tracking

Satellite code and carrier-phase tracking messages from the device.

MSG_TRACKING_STATE — 0x0041 — 65

The tracking message returns a variable-length array of tracking channel states. It reports status and carrier-to-noise density measurements for all tracked satellites.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-----------|--------------------|---|
| 4N + 0 | 1 | u8 | | states[N].sid.sat | Constellation-specific satellite identifier |
| 4N + 1 | 1 | u8 | | states[N].sid.code | Signal constellation, band and code |
| 4N + 2 | 1 | u8 | | states[N].fcn | Frequency channel number (GLONASS only) |
| 4N + 3 | 1 | u8 | dB Hz / 4 | states[N].cn0 | Carrier-to-Noise density. Zero implies invalid cn0. |
| | 4 <i>N</i> | | | | Total Payload Length |

MSG_TRACKING_IQ — 0x002C — 44

When enabled, a tracking channel can output the correlations at each update interval.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|-------------------|--------------|--------|-------|------------|---|
| 0 | 1 | u8 | | channel | Tracking channel of origin |
| 1 | 1 | u8 | | sid.sat | Constellation-specific satellite identifier |
| 2 | 1 | u8 | | sid.code | Signal constellation, band and code |
| 8N + 3 | 4 | s32 | | corrs[N].I | In-phase correlation |
| 8N + 7 | 4 | s32 | | corrs[N].Q | Quadrature correlation |
| | 8N + 3 | | | | Total Payload Length |

7.9 User

Messages reserved for use by the user.

MSG_USER_DATA — 0x0800 — 2048

This message can contain any application specific user data up to a maximum length of 255 bytes per message.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|-------|----------|----------------------|
| 0 | Ν | u8[N] | | contents | User data payload |
| | Ν | | | | Total Payload Length |

7.10 Vehicle

Messages from a vehicle.

MSG_ODOMETRY — 0x0903 — 2307

Message representing the x component of vehicle velocity in the user frame at the odometry reference point(s) specified by the user. The offset for the odometry reference point and the definition and origin of the user frame are defined through the device settings interface. There are 4 possible user-defined sources of this message which are labeled arbitrarily source 0 through 3.

| Offset (bytes) | Size (bytes) | Format | Units | Name | Description |
|----------------|--------------|--------|-------|----------|--|
| 0 | 4 | u32 | ms | tow | Time field representing either milliseconds in the GPS Week or local CPU time from the producing system in milliseconds. See the tow_source flag for the exact source of this timestamp. |
| 4 | 4 | s32 | mm/s | velocity | The signed forward component of vehicle velocity. |
| 8 | 1 | u8 | | flags | Status flags |
| | 9 | | | | Total Payload Length |
